

SHRING

Overview

Shring contains a preamp with gain control and a three fold waveshaper with final signal mixing stage.

The wavefolder creates strong even harmonics, similar to fm synthesis, but achieved with with a subtler analogue apparatus. Higher harmonics accumulate with increased gain settings and react dynamically to input amplitude, unfolding and sweeping through the harmonic field as the signal decays.

Note combinations create clangorous and bellish overtones that can be subtle or pushed to the limit with very little fundamental remaining.

Technica

Input impedance 474

Output impedance 125

True Bypass

Consumes 9mA current

Power supply 9-12VDC, 2.1mm, center pin negative.
